3.1 System Design

The proposed system automates the complete process of ordering a standard laptop. The employee submits a laptop request through the ServiceNow Service Catalog. **Flow Designer** automatically manages approval, availability checking, task creation, notifications, asset assignment, and request closure.

System Architecture

3.2 Workflow Design

Flow Designer Workflow

START

Employee submits laptop request

Validate request details

Send request to Manager

Manager Approval

No → Reject Request

Yes

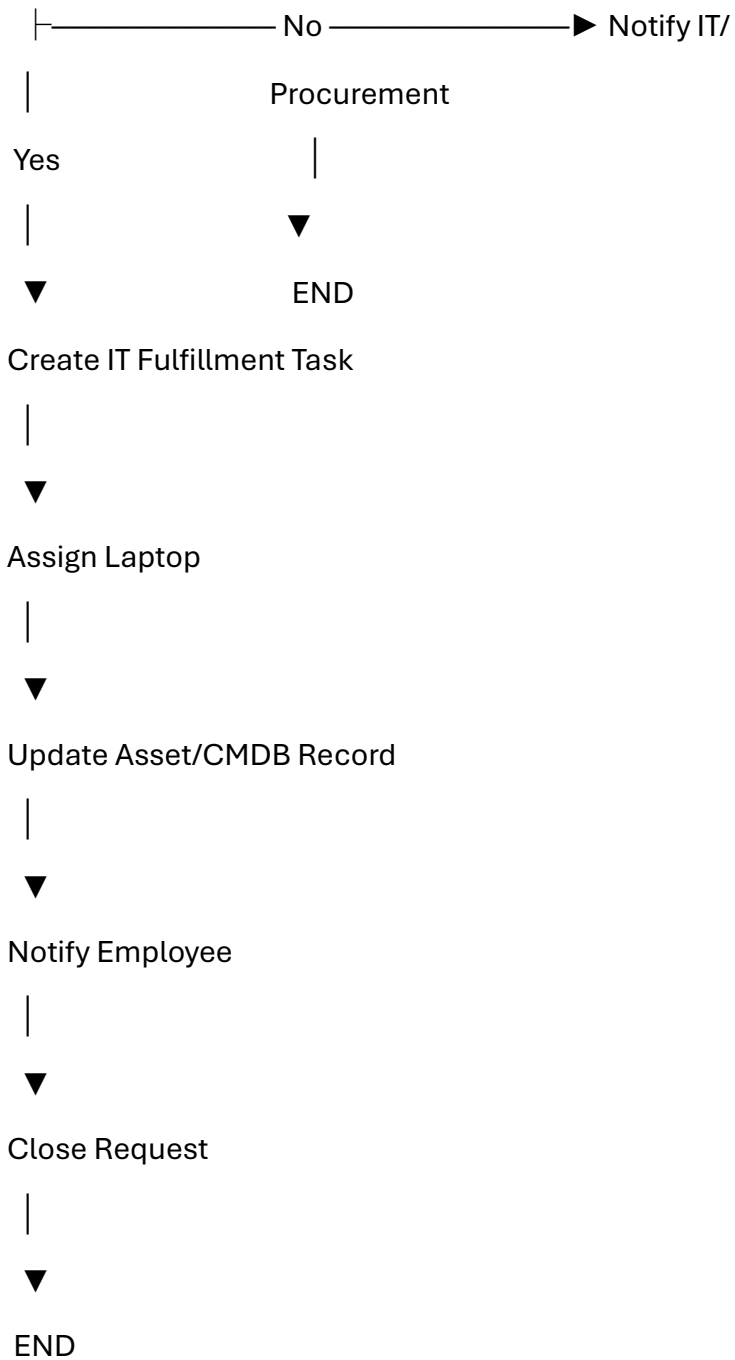

Notify Employee

Check Laptop Availability

END

3.3 Input Design

The laptop request form should contain the following fields:

Field	Description
Employee Name	Name of the person requesting the laptop
Employee ID	Unique employee identification

Field	Description
Department	Employee's department
Manager	Employee's reporting manager
Laptop Type	Standard Laptop
Business Justification	Reason for requesting the laptop
Required Date	Date on which the laptop is needed
Location	Employee's work location
Contact Details	Email/contact information

Input Validation

- Employee name and ID should be mandatory.
- Manager information should be available.
- Laptop type should be selected.
- Business justification should not be empty.
- Required date should be valid.
- Duplicate or incomplete requests should be prevented where applicable.

3.4 Process Design

Step	Process	System Action
1	Request submission	Create laptop request
2	Validation	Check required information
3	Approval	Send request to manager
4	Approval decision	Approve or reject
5	Availability	Check laptop inventory
6	Fulfillment	Create IT task
7	Assignment	Assign available laptop

Step	Process	System Action
8	Asset update	Update asset/CMDB record
9	Notification	Inform employee
10	Closure	Close completed request

3.5 Database / Table Design

The solution can use ServiceNow tables to maintain the required information.

Laptop Request Table

Field	Purpose
Request Number	Unique request identifier
Requested For	Employee requesting the laptop
Department	Employee department
Manager	Approver
Laptop Type	Requested laptop category
Justification	Reason for request
Status	Current request status
Approval Status	Approval result
Assigned Laptop	Asset assigned to employee
Created Date	Request creation date
Completed Date	Request completion date

Asset Information

The asset/CMDB information can contain:

- Asset ID
- Serial Number
- Laptop Model
- Laptop Type

- Availability Status
- Assigned User
- Location
- Asset State

3.6 User Interface Design

Laptop Request Form

STANDARD LAPTOP REQUEST	
Employee Name:	
Employee ID:	
Department:	
Manager:	
Laptop Type:	[Standard Laptop ▼]
Required Date:	
Location:	
Justification:	
	[Submit Request]

3.7 Notification Design

The system should generate automatic notifications at important stages.

Event	Notification
Request submitted	Request confirmation to employee

Event	Notification
Request approved	Approval notification
Request rejected	Rejection notification
Laptop unavailable	Availability notification
IT task created	Fulfillment notification
Laptop assigned	Assignment notification
Request completed	Completion notification

3.8 Security Design

- Only authorized employees can submit laptop requests.
 - Managers can approve requests assigned to them.
 - IT users can access fulfillment tasks.
 - Asset information should be accessible only to authorized users.
 - User and asset data should be protected using appropriate ServiceNow access controls.
 - All important actions should be recorded for auditing.
-

3.9 Exception Handling

The system should handle exceptional situations automatically:

- **Request rejected:** Update status to rejected and notify the employee.
- **Laptop unavailable:** Notify the appropriate IT/procurement team.
- **Missing information:** Return the request for correction.
- **Fulfillment delay:** Escalate or notify the responsible team.
- **Assignment failure:** Keep the request open and notify IT.
- **Duplicate request:** Identify and prevent unnecessary duplicate processing.
